| PATIENT NAME: | Maria Gomez                           | ACCESSION #:     | ACC-2026-US-004      |
| MRN / ID:     | MRN-US-77182                          | STUDY DATE:      | 2026-09-14           |
| AGE / GENDER: | 39 Y / F                              | MODALITY / PART: | ULTRASOUND - THYROID |
| REFERRING DR: | Dr. Carlos Mendez, MD (Endocrinology) | READING STATUS:  | DRAFT                |

### CLINICAL INDICATION & HISTORY

39-year-old female with asymptomatic fullness in right lower neck noted during routine preventive physical examination.

### EXAMINATION TECHNIQUE

High-resolution grayscale sonography and color Doppler interrogation of the thyroid gland bilaterally.

### AI-DETECTED QUANTITATIVE FINDINGS (MONAI / CheXagent)

| Anatomical Zone           | Category | Radiologic Finding                                                                                                                                                                    | Severity | Confidence |
|---------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|------------|
| Right Thyroid<br>Mid-Pole | NODULE   | Solid, mildly hypoechoic nodule in the right thyroid lobe mid-pole measuring 14 x 11 x 12 mm with smooth margins, wider-than-tall configuration, and no internal microcalcifications. | MODERATE | 86%        |

### DETAILED NARRATIVE FINDINGS

• Right Lobe: Measures 4.2 x 1.6 x 1.5 cm. Mid-pole contains a 1.4 cm solid, mildly hypoechoic nodule with peripheral vascular halo. • Left Lobe: Measures 3.8 x 1.4 x 1.3 cm. Homogeneous echotexture without focal nodules. • Lymph Nodes: No suspicious cervical lymphadenopathy identified.

### IMPRESSION

#### IMPRESSION & REASONING (MedGemma AI Synthesis):

1. Solitary 1.4 cm mildly hypoechoic nodule in the mid-pole of the right thyroid lobe. 2. Classified under ACR TI-RADS as TR3 (Mildly Suspicious, 3 points).

Standardized Classification: ACR TI-RADS: TR3

### RECOMMENDATIONS / NEXT STEPS

1. Follow-up sonogram in 12 months to document size stability (biopsy threshold for TR3 is  $\geq 2.5$  cm). 2. Baseline serum TSH level if not already acquired.

### CLINICAL AI COPILOT NOTES & EXPLAINABILITY

MONAI TI-RADS workflow points: Composition (Solid=2), Echogenicity (Hypoechoic=1), Shape (Wider-than-tall=0), Margin (Smooth=0), Echogenic foci (None=0). Total: 3 points (TR3).
